

DANIEL NG

604-727-3233 | daniel.wnh@outlook.com | danielng.pages.dev | linkedin.com/in/danielngEE | github.com/danielwnh25

Education

University of British Columbia

BASc in Electrical Engineering (Co-op, available May 2026)

Expected Graduation: May 2028

Vancouver, BC

Experience

Norsat International Inc.

June 2025 – August 2025

Hardware Test Intern

Richmond, BC

- Characterized Ku-Band Block-Up Converters (gain, P_{sat} , P1dB, spurious, IMD3, noise figure) using VNAs, signal analyzers, oscilloscopes, and multimeters to ensure 100% compliance with hardware specifications.
- Optimized RF power module stability by precisely sweeping DAC control codes, significantly reducing variance in output power prior to final acceptance testing.
- Assembled and troubleshoot BUCs and LNBs at the PCBA level, performing microscopic SMT and THT soldering and inspection to maintain quality standards for high-sensitivity MMIC chips.
- Verified and troubleshoot SSPA boards by conducting continuity tests and cross-referencing schematics to identify and rectify DC bias instability, ensuring 100% yield for high-power MMIC stages.

UBC Formula Design Team

September 2025 – Present

Firmware Subteam: Timing Gates Project Lead

Vancouver, BC

[GitHub](#)

- Led end-to-end development of a laser receiver, including optomechanical shrouding coupled with a custom 3.3 V CMOS analog front end and 2.4 GHz communication between master-slave ESP32-S3 MCUs to calculate speed and lap times.
- Characterized baseline photodiode thermal dark current and TIA voltage noise to calibrate an adjustable hysteresis threshold via potentiometer, targeting a 20 dB SNR and $BER < 10^{-7}$ to ensure high-speed data integrity.

Projects

Interrupt-Driven Alarm Clock | A51 Assembly, N76E003 (8051) MCU

January 2026

[GitHub](#)

- Engineered a real-time settable clock using a 16.6 MHz oscillator to drive timers and interrupts.
- Utilized Timer 0 to generate a stable 2 kHz square wave for audio signaling and Timer 2 to manage high-precision half-second BCD clock increments.
- Interfaced a 4-bit LCD for time/alarm display and implemented a sampling-based debouncing algorithm coupled with decoupling capacitors for pushbutton inputs to eliminate noise.

Temperature Telemetry System | Python, C, A51 Assembly, N76E003, RS-232, ADC

January 2026

[GitHub](#)

- Designed a high-precision analog front-end by interfacing an LM335 sensor with a 12-bit SAR ADC, utilizing an LM4040 external voltage reference ($V_{REF} = 4.096V$) to eliminate measurement instability inherent in internal band-gap references.
- Engineered a 32-bit assembly math library to execute voltage-to-temperature transfer functions via integer-scaling, enabling 115.2 kbps telemetry transmission via RS-232 to a custom Python suite for real-time data visualization.

FPGA VGA Driver | C, DE10-Lite FPGA, MMIO, VGA

November 2025

[GitHub](#)

- Developed a custom VGA graphics driver using MMIO to manage frame buffers, rendering dynamic light traces for a fully functional, one-player "Tron Light Cycle" game, while maintaining real-time pixel updates at VGA timing constraints.
- Implemented interrupt-driven input handling to handle asynchronous pushbutton events, reducing input latency compared to traditional polling.
- Engineered an autonomous robot opponent with predictive collision logic, performing real-time memory reads of the VGA buffer to scan for obstacles and update movement vectors.

Technical Skills

Digital Design/HDL/Low-Level: SystemVerilog, RISC-V, A51 Assembly, FSM Implementation & Design, FPGA
Embedded Systems: CAN, USB, SPI, UART, I2C, ESP32 and 8051-family MCUs, C Embedded Firmware, Bare Metal
Design Tools: Quartus Prime, Questa/ModelSim, Altium Designer, CPUlator, MS Excel
Hardware & Lab: VNA, Signal Analyzer, PCB Design and Debugging, SMT/THT Soldering, Oscilloscope, Multimeter
